<tbody>
<tr>
<td>Olaparib is a poly(adenosine diphosphate-ribose) polymerase (PARP) inhibitor</td>
<td>Lynparza® is indicated as monotherapy for the maintenance treatment of adult patients with germline BRCA1/2-mutations who have metastatic adenocarcinoma of the pancreas and have not progressed after a minimum of 16 weeks of platinum treatment within a first-line chemotherapy regimen.</td>
</tr>
</tbody>
</table>

### Current treatment [3]

- According to NICE guidance, patients with metastatic pancreatic cancer should be offered:
  - A combination of folic acid, fluorouracil, irinotecan and oxaliplatin (FOLFIRINOX) as a first-line treatment
  - Gemcitabine should be offered to patients who are not well enough to tolerate FOLFIRINOX
  - Oxaliplatin-based chemotherapy as second-line treatment should be considered for people who have not had first-line oxaliplatin
  - Gemcitabine-based chemotherapy as second-line treatment should be considered for people whose cancer has progressed after first-line FOLFIRINOX
  - Surveillance should be offered for pancreatic cancer with BRCA mutations.

### Regulatory status

#### Approval status for this indication:
- **EMA [1]**: On 28 May 2020, the CHMP adopted a new indication in adenocarcinoma of the pancreas.
- **FDA [4]**: On 27 December 2019, the FDA approved Lynparza® for the maintenance treatment of adult patients with deleterious or suspected deleterious germline BRCA-mutated (gBRCAm) metastatic pancreatic adenocarcinoma, as detected by an FDA-approved test, whose disease has not progressed on at least 16 weeks of a first-line platinum-based chemotherapy regimen.

### Other indications

- **Ovarian cancer**: Lynparza® is indicated as monotherapy for the:
  - maintenance treatment of adult patients with advanced (FIGO stages III and IV) BRCA1/2-mutated (germline and/or somatic) high-grade epithelial ovarian, fallopian tube or primary peritoneal cancer who are in response (complete or partial) following completion of first-line platinum-based chemotherapy
  - maintenance treatment of adult patients with platinum-sensitive relapsed high-grade epithelial ovarian, fallopian tube, or primary peritoneal cancer who are in response (complete or partial) to platinum-based chemotherapy

- **Breast cancer**
  - Lynparza® is indicated as monotherapy for the treatment of adult patients with germline BRCA1/2-mutations, who have HER2 negative locally advanced or metastatic breast cancer. Patients should have previously been treated with an anthracycline and a taxane in the (neo)adjuvant or metastatic setting unless patients were not suitable for these treatments
  - Patients with hormone receptor-positive breast cancer should also have progressed on or after prior endocrine therapy, or be considered unsuitable for endocrine therapy.

### Posology [5]

- Patients should start treatment with olaparib no later than 8 weeks after completion of their final dose of the platinum-containing regimen.
- It is recommended that treatment be continued until progression of the underlying disease or unacceptable toxicity
- Important differences in posology between olaparib capsules and tablets: Lynparza® capsules (50 mg) should not be substituted for Lynparza® tablets (100 mg and 150 mg) on a milligram-to-milligram basis due to differences in the dosing and bioavailability of each formulation.
## Costs

112 Lynparza® tablets 150 mg = €5,059.29 (ex-factory price) [6]

POLO trial patients received maintenance olaparib tablets at a dose of 300 mg daily → approx. €2,530 for 28 days of olaparib treatment.

Among patients of the POLO trial, the median duration of treatment was 6.0 months → costs of approx. €15,174.87

## Study characteristics [2, 7]

### Efficacy (I vs. C)

- **Median PFS**: 7.4 months vs. 3.8 months; HR for disease progression or death, 0.53; 95% CI, 0.35 to 0.82; p=0.004)
- **Median OS (interim analysis at a data maturity of 46%)**: 18.9 vs. 18.1 months, HR 0.91; 95% CI, 0.76 to 1.12; p=0.32
- **Second PFS** (at a data maturity of 46%, median): 13.2 vs. 9.2 months, HR 0.76; 95% CI, 0.61 to 1.00; p=0.08
- **Response rate** (among patients with measurable disease at baseline): 23% vs. 12% (odds ratio, 2.30; 95% CI, 0.89 to 6.76).
- **Median duration of response**: 24.9 (95% CI, 14.8 to could not be calculated) vs. 3.7 months (95% CI, 2.1 to could not be calculated)
- **Median time to response**: 5.4 vs. 3.6 months

### Safety (I vs. C)

- **Any AE grade ≥3**: n=36/91 (40%) vs. n=14/60 (23%)
- **SAEs**: 24% vs. 15%
- **Death**: No AEs that occurred during the trial intervention resulted in death
- **Discontinuation**: n=5/91 (5%) vs. n=1/60 (2%)

### Risk of bias (study level)

- **Adequate generation of randomisation sequence**
- **Adequate allocation concealment**
- **Blinding**
- **Selective outcome reporting unlikely**
- **Other aspects which increase the risk of bias**

### Risk of bias

- **Adequacy of randomisation sequence**: yes
- **Allocation concealment**: yes
- **Blinding**: yes
- **Selective outcome reporting unlikely**: yes

### Risk of bias level

- **Randomisation sequence**: unclear
- **Allocation concealment**: unclear
- **Blinding**: unclear
- **Selective outcome reporting unlikely**: unclear

### Abbreviations:

- AE=adverse event, AJ=adjustment, BRCA1=Breast Cancer susceptibility gene, CHMP=Committee for Medicinal Products for Human Use, CI=confidence interval, EMA=European Medicines Agency, ESMO-MCBS= European Society of Medical Oncology – Magnitude of Clinical Benefit Scale, FDA=Food and Drug Administration, FIGO= The International Federation of Gynecology and Obstetrics, FM=final magnitude of clinical benefit grade, HR=hazard ratio, HRD=homologous recombination deficiency, HRQoL=health-related quality of life, HRR=homologous recombination repair, MG=median gain, n=number, ND=no difference, SAE=serious adverse event, ST=standard treatment, OS=overall survival, PE=primary endpoint, PFS=progression-free survival, PM=preliminary grade, QoL=quality of life

---

1. POLO trial is ongoing until 02/2021
2. Time from randomization to second disease progression or death
3. Death due to AE(s)
4. Discontinuation due to AE(s)
5. Trial is ongoing
6. Industry-funded; The trial was designed by the first and last authors in collaboration with the sponsor. The sponsor was responsible for overseeing the collection, analysis, and interpretation of the data. The co-developer of olaparib provided input regarding the interpretation of the data.
